AI Token Saver

I built a fix for wasted AI tokens.

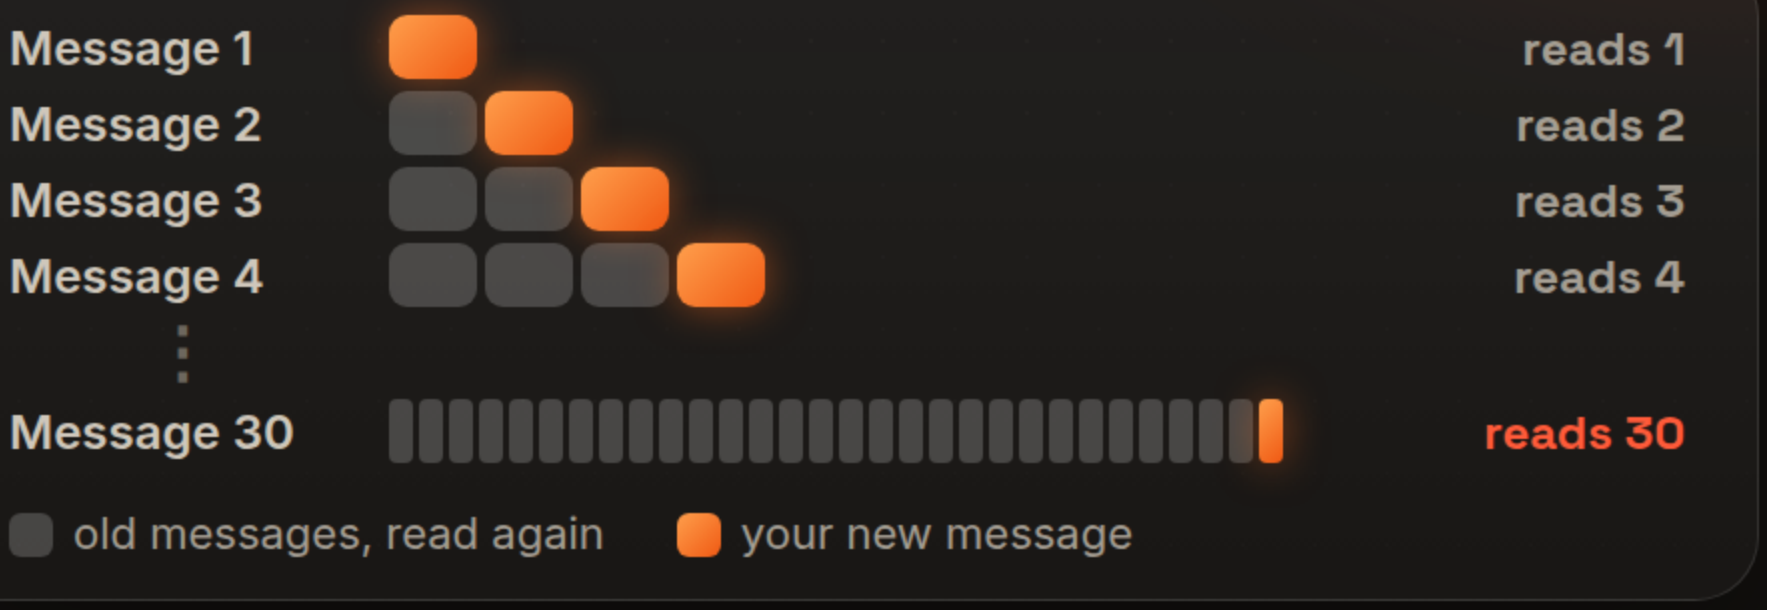

~40% fewer tokens on long chats in my tests

Live on Chrome Web Store · Claude · ChatGPT · E2E tested

THE PROBLEM

AI re-reads the whole chat every time you hit send

MESSAGE 30 IN MY TEST CHAT

"...what should i do this week and what are the open questions still?"

42	+	47,396	=	47,438
tokens you typed		tokens of old chat		tokens the AI reads

Tokens are the small pieces of text AI reads, about ¾ of a word each. The more it reads, the faster you hit your limit.

HOW IT WORKS

At 20k tokens, this pops up

BigQuery OTT pipeline design

Partition the events table by `event_date` and cluster on `user_id`, `content_id`. For the 90-day backfill, load into a staging table first, check row counts, then swap it in with one MERGE.

Can you add a freshness check in Looker too?

This chat is getting long **~21k tokens**

Every new message re-sends the whole conversation, so each reply uses more of your limit. Summarize it and continue in a fresh chat?

Ask anything

1 Chat writes a summary → 2 New chat opens → 3 You keep going

— TOKENS SAVED

36–44%

fewer tokens on the two long test chats

Includes the cost of writing and sending the summary. Hand off too late and most of the saving is gone.

HARD PROBLEMS I SOLVED

Disappearing messages

ChatGPT unloads old messages from the page, so replies are detected by content, not by count.

Three kinds of text box

Each site's editor is different, so text goes in by 3 fallback methods, each one verified.

Proved, not assumed

Automated browser tests (Playwright) run the full handoff on a mock of every site.

`JavaScript` `Chrome Manifest V3` `Playwright` `Node.js` `Tokenizer`

HOW I TESTED

How I measured it

1

3 long chats

My real chat building this extension, plus 2 realistic test chats. 16k–49k tokens each.

2

Full replay

Every message replayed with and without handoffs, using the extension's own prompt.

3

Blind quiz

150 questions answered from the summary only, graded against an answer key.

Limits: savings were calculated by replaying the chats, not measured inside each app. Providers cache chat history, so the effect on your limit may be smaller.
